

CPD TINY PROJECT

TO-DO LIST WEB APPLICATION

Project Documentation

Developed using HTML, CSS and JavaScript

Submitted as a College CPD Tiny Project

Academic Year: 2026–2027

1. Abstract

The To-Do List is a simple web-based task management application. It allows users to add tasks, mark tasks as completed, delete tasks and remove completed tasks. The application uses browser Local Storage so that tasks remain available after refreshing the page.

2. Introduction

Managing daily tasks manually can be difficult. This project provides a simple digital solution for creating and tracking tasks. The application has a clean interface and can be used on desktop and mobile devices.

3. Problem Statement

Users need a simple way to record daily activities and track which activities are completed. A basic task management application can solve this problem without requiring a complex database or login system.

4. Objectives

The main objectives are to create a simple task management interface, add and delete tasks, mark tasks as completed, maintain task data using Local Storage, and provide a responsive user interface.

5. Scope

The project is suitable for personal task management and academic demonstration. It can be extended in the future with user accounts, database storage, reminders, categories and due dates.

6. Technologies Used

HTML5 is used for page structure. CSS3 is used for styling and responsive design. JavaScript is used for task operations and application logic. Browser Local Storage is used for persistent task data.

7. Main Modules

The project contains four main functions: Add Task, Complete Task, Delete Task, and Clear Completed Tasks. A task counter displays pending and total tasks.

8. System Requirements

Hardware: any basic computer or laptop with a modern web browser. Software: VS Code or another code editor and a browser such as Chrome, Edge, Firefox or Safari. No server or database is required.

9. Working of the System

The user enters a task in the input field and clicks Add Task. JavaScript creates the task and stores it in Local Storage. A checkbox changes the completion status. The Delete button removes an individual task. Clear Completed removes all completed tasks.

10. Testing

The application was designed to test adding a valid task, attempting to add an empty task, completing a task, deleting a task, clearing completed tasks, refreshing the browser and checking responsive behavior.

11. Expected Result

The application should successfully add, display, complete and delete tasks. Task information should remain available after browser refresh because it is stored in Local Storage.

12. Advantages

The application is simple, fast, easy to understand, does not require a server, works offline after loading, and is suitable for beginners learning web development.

13. Limitations

Tasks are stored only in the current browser. There is no user authentication, cloud synchronization, database or reminder notification.

14. Future Scope

Future versions can include login and registration, MySQL database integration, REST APIs, task categories, due dates, reminders, priority levels and cloud synchronization.

15. Conclusion

The To-Do List project demonstrates the basic concepts of frontend web development and JavaScript programming. It provides a practical example of DOM manipulation, event handling, Local Storage and responsive design.

16. GitHub Repository Structure

The repository contains the main HTML file, CSS stylesheet, JavaScript file, documentation PDF, screenshots folder, README file and Git ignore file. This structure makes the project easy to upload, maintain and demonstrate on GitHub.

17. Basic Test Cases

Test Case	Action	Expected Result
TC01	Enter task and click Add	Task is displayed
TC02	Click checkbox	Task becomes completed
TC03	Click Delete	Task is removed
TC04	Click Clear Completed	Completed tasks are removed
TC05	Refresh browser	Saved tasks remain available
